

The Canadian new Air Quality Health Index, 2008 Evaluation

Jacques Rousseau

Environnement Canada, Meteorological Service of Canada - Québec Region

NOAA David Skaggs Research Center
Boulder, Colorado 2-3 December 2009

Background

The Air Quality Health Index (AQHI) is a new tool developed by Health Canada and Environment Canada in partnerships with health and environment agencies to better inform Canadian population about health impact of air quality and to help individuals take steps to protect their health. The AQHI incorporate the sum of health risks of three concurrent pollutants exposures: Ground-level ozone (O₃), particulate matter (PM_{2.5}/PM₁₀) and nitrogen dioxide (NO₂). The values of AQHI range in a linear scale from 1 to 10+. The AQHI values are also grouped into health risk categories. The maximum likely AQHI is predicted during the giving period forecast. In 2008 the new AQHI was implemented in 5 different provinces: British Columbia, Ontario, Nova Scotia, New Brunswick and Québec.

$$AQHI = K(e^{(AQI_{O3})} - 1) + K(e^{(AQI_{PM2.5})} - 1) + K(e^{(AQI_{NO2})} - 1)$$

Sum of health impact of 3 pollutants (NO₂, PM_{2.5}/PM₁₀, O₃) into 10 different levels, 3 hours running average

General information's

AQHI forecast issued twice a day (Forecast Max value) at around 5:00 AM for :
 - Today time issued (6:00 AM) to 6:00 PM
 - Tonight 6:00 PM to 6:00 AM
 - Tomorrow 6:00 AM to midnight 24:00 PM
 at around 4:00 PM for :
 - Tonight time issued (6:00 PM) to 6:00 AM
 - Tomorrow 6:00 AM to midnight 24:00 PM

Distribution of AQHI observed

Provinces	Categories of risk observed		
	Low	Moderate	High
B.C.	96.5%	3.5%	0.02%
N.B.	97.5%	2.5%	0.00%
N.S.	98.1%	1.8%	0.06%
Ontario	82.8%	17.0%	0.18%
Québec	92.8%	7.2%	0.00%
Canada	92.5%	7.5%	0.07%

During the year of 2008, Environment Canada had forecasted AQHI for 25 differences location across Canada. Most of the time (92%) AQHI values are in the low category in Canada except for Ontario with 83% in this category. High health category remains rare even accounting for less than 0.07% except 0.18% for Ontario. Greatest variability in AQHI values is observed during summer season mainly due to more predominance ozone production.

AQHI observations & forecasts availability in 2008

Provinces	Forecasts & Obs available	Missing Forecast	Missing Obs	Missing Forecast & Obs
British Columbia	67.8%	1.6%	31.6%	1.0%
New-Brunswick	86.5%	3.3%	11.5%	1.3%
Nova-Scotia	80.9%	4.8%	16.6%	2.3%
Ontario	95.8%	0.8%	3.5%	0.1%
Québec	36.6%	30.6%	40.3%	7.4%
Total	74.8%	1.8%	24.3%	0.9%

Performance indicator

PC: Percentage Correct (ideal value 1)

POD: Probability of Detection (ideal value 1)

FAR: False Alarm Ratio (ideal value 0)

CSI: Critical Success Index (Threat Score) (ideal value 1)

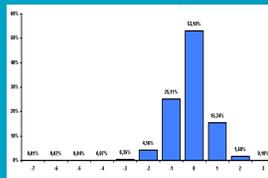

$$PC = \frac{\text{All Hits}}{\text{Total Forecast}}$$

$$POD = \frac{\text{Hits}}{\text{Hits} + \text{Misses}}$$

$$FAR = \frac{FA}{\text{Hits} + FA}$$

$$CSI = \frac{\text{Hits}}{\text{Hits} + \text{Misses} + FA}$$

Distribution AQHI forecast error for 2008 All Canada

Differences between time emission of forecast bulletin

Provinces	Percentage correct					
	Forecast for tonight (8h à 6h)			Forecast for tomorrow (6h à 24h)		
	AM issue	PM issue	A	AM issue	PM issue	A
British Columbia	52.9%	59.4%	6.5%	48.2%	48.6%	0.4%
New-Brunswick	58.4%	63.1%	4.8%	58.2%	59.3%	1.3%
Nova-Scotia	48.3%	62.5%	14.2%	42.1%	47.4%	5.3%
Ontario	50.1%	57.6%	7.5%	47.8%	53.1%	5.3%
Québec	33.3%	25.6%	27.7%	38.9%	41.0%	2.1%

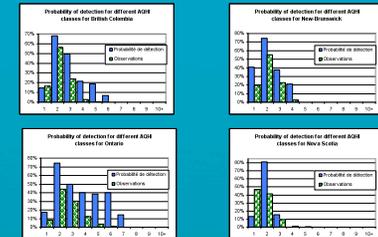

Verification again observations had showed that accuracy of AQHI forecast is correct at 50 to 60% of the time depending of the period forecast. As not surprise the accuracy increase as the period forecast get closer of the time forecast issue. Considering tolerance forecast error of plus or minus one AQHI digit, the forecast accuracy rise to nearly 92% in Canada, well above of the threshold of 80% in the SOR. The only province who doesn't meet the criteria is Québec with tolerance ± 1 of only 73% mainly due to the lack of data.

Time Issue	Period of forecast	Provinces	N	Tolerance error				
				0	-1	+1	-2	+2
05:00 AM Local time	Today	Colombie-Britannique	3225	92.3%	94.2%	95.2%	95.4%	95.4%
		Nouveau-Brunswick	187	94.8%	92.9%	93.3%	93.3%	93.3%
		Québec	39	94.2%	94.2%	98.3%	98.3%	98.3%
		Ontario	1497	95.1%	97.1%	100.0%	100.0%	100.0%
		Colombie-Britannique	11	10.0%	70.0%	100.0%	100.0%	100.0%
		Québec	17	64.7%	76.5%	90.0%	90.0%	90.0%
	Tomorrow	Colombie-Britannique	3311	88.2%	90.0%	90.2%	90.2%	90.2%
		Nouveau-Brunswick	194	85.1%	89.2%	94.3%	94.3%	94.3%
		Québec	41	82.4%	91.2%	98.3%	100.0%	100.0%
		Ontario	1496	87.8%	91.1%	95.1%	95.1%	95.1%
		Colombie-Britannique	18	50.0%	50.0%	100.0%	100.0%	100.0%
		Québec	13	69.2%	95.8%	95.2%	95.2%	95.2%
16:00 PM Local time	Tonight	Colombie-Britannique	3311	83.1%	91.0%	100.0%	100.0%	100.0%
		Nouveau-Brunswick	20	85.0%	95.0%	100.0%	100.0%	100.0%
		Québec	39	85.0%	94.0%	98.3%	98.3%	98.3%
		Ontario	1496	87.8%	91.1%	95.1%	95.1%	95.1%
		Colombie-Britannique	18	50.0%	50.0%	100.0%	100.0%	100.0%
		Québec	13	69.2%	95.8%	95.2%	95.2%	95.2%

Probability of detection (POD)

False Alert Ratio (FAR)

Critical Success Index (CSI)

Conclusion

Tolerance forecast error of ± 1 is met at 90% of the time except for Québec region mainly due to insufficient data. The POD generally decrease as AQHI values get higher except in Ontario where POD remains at around 40% for AQHI from 3 to 6. The most predominant AQHI value is 2 with POD ranging from 65 to 80%. FAR trend to increase with AQHI value except for AQHI of 1 where it's over forecasted.
